

Solution Requirements

Date	29 September 2026
Team ID	SWTID-2026-2087
Project Name	POCKET SMART AI
Maximum Marks	4 Marks

Define Functional and Non-Functional Requirements:

Create a comprehensive list of requirements to define exactly what your solution will do and how well it will perform.

- Functional Requirements (FR) define specific behaviors, functions, or features of the system (What the system should do).
- Non-Functional Requirements (NFR) specify the criteria that judge the operation of a system, rather than specific behaviors (How the system should be).

Fill out the descriptions and necessary details for each category provided below.

Step 1: Functional Requirements (FR)

S.No	Requirement Category	Requirement Description	Priority (High/Medium/Low)
1	Authentication	Users can securely sign in and access their PocketSmart AI account using valid credentials.	High
2	Authorization levels	User access is limited to their own profile, expenses, budgets and insights; administrative access is restricted to authorized roles.	Medium
3	External interfaces	The system may connect to an AI service/API for generating financial insights and recommendations, where configured.	Medium
4	Transactions processing	The system accepts expense/income entries, validates the data, categorizes transactions and updates budget calculations.	High
5	Reporting	The system provides expense summaries, category-wise spending, budget status and savings insights through the dashboard.	High
6	Business rules, etc.	Expenses are grouped by category; budget usage is calculated from recorded transactions; alerts are generated when spending approaches or exceeds the budget.	High
7	Compliance to laws or regulations	The system should handle personal financial data responsibly, provide privacy controls and avoid exposing user data to unauthorized users.	High
8	Other	Users can set budgets, view spending history, receive alerts and obtain personalized saving suggestions from the PocketSmart AI system.	High

Step 2: Non-Functional Requirements (NFR)

S.No	NFR Category	Requirement Description	Target Metric / Acceptance Criteria
1	Performance & Speed	The system should provide quick page loads and prompt processing for expense entry, budget calculations and dashboard updates.	Page/dashboard actions should load or respond within 2 seconds under normal project conditions.
2	Scalability	The design should allow additional users, transactions and stored financial records without major redesign.	Support growth in users and transaction records with stable performance.
3	Security & Data Privacy	Protect personal and financial information through authenticated access, restricted data access and secure data handling.	Only authorized users can access their own financial records; sensitive data is not exposed in the interface.
4	Reliability & Availability	The system should remain available during normal operation and handle invalid inputs without crashing.	Core functions should work consistently; errors should be handled with clear messages.
5	Usability & Accessibility	The interface should be simple, mobile-friendly, readable and easy for college students to understand.	Common tasks such as adding an expense or checking budget status should be completed with minimal steps.
6	Other	The application should be maintainable and modular so features such as new categories, reports or AI recommendations can be updated easily.	Changes to one module should require minimal changes to unrelated modules.

Step 2: Non-Functional Requirements (NFR) — Detailed Acceptance Criteria

S.No	NFR Category	Requirement Description	Target Metric / Acceptance Criteria
1	Performance & Speed	The system should provide quick page loads and prompt processing for expense entry, budget calculations and dashboard updates.	Page/dashboard actions should load or respond within 2 seconds under normal project conditions.
2	Scalability	The design should allow additional users, transactions and stored financial records without major redesign.	Support growth in users and transaction records with stable performance.
3	Security & Data Privacy	Protect personal and financial information through authenticated access, restricted data access and secure data handling.	Only authorized users can access their own financial records; sensitive data is not exposed in the interface.
4	Reliability & Availability	The system should remain available during normal operation and handle invalid inputs without crashing.	Core functions should work consistently; errors should be handled with clear messages.
5	Usability & Accessibility	The interface should be simple, mobile-friendly, readable and easy for college students to understand.	Common tasks such as adding an expense or checking budget status should be completed with minimal steps.
6	Other	The application should be maintainable and modular so features such as new categories, reports or AI recommendations can be updated easily.	Changes to one module should require minimal changes to unrelated modules.

POCKET SMART AI — Solution Requirement Summary

The requirements define what PocketSmart AI should do and how well it should operate: record expenses, manage budgets, analyse spending, provide reports and AI-assisted recommendations, while maintaining security, usability, reliability, performance and maintainability.
