

POCKET SMART AI — Your Smart Budget & Recommendation Assistant

Phase 8: Project Demonstration

St. George's Arts and Science College (UNM1727) · TN Skills | Generative AI · Team ID: SWTID-2026-2087

Team Leader: Monish B | Members: Jagadeeshwaran S, Shannon Cadric Jacob, Preethika B, Naresh S

8.1 Purpose of This Phase

This phase presents Pocket Smart AI as demonstrated end-to-end: the system output, the screenshot evidence of the working application, and the practical impact the demonstration is intended to show.

8.2 System Output

The completed system provides an accessible budgeting and recommendation workflow, moving from user access and input to an organized planning result across three demonstrated planners: Home Interior, Party, and Jewelry.

8.3 Screenshot Evidence Register

The following screenshots, captured from the working application, form the visual evidence used during the demonstration:

#	Screen	What It Shows
1	Landing Page	Product introduction: 'Spend smarter across home, events, and jewelry,' with Gemini AI mode indicator.
2	Create Account	Registration form (full name, username, email, password).
3	Login	Returning-user login form with a link to registration.
4	Dashboard	Personalized greeting and the three planner options: Home Interior, Party, Jewelry.
5	Plan a Home Budget	Input form for total budget, lights, fans, furniture, dining tables, rooms, and notes.
6	Home Budget Result	Generated plan with total/remaining/allocated amounts and category recommendations.
7	Party Budget Result	Generated plan for catering, decoration, and entertainment with store-link tags.
8	Jewelry Planner	Budget/occasion/style input with optional outfit image upload, and the resulting item recommendations.
9	Saved Recommendations (History)	Locally stored (SQLite) list of past plans with remaining budget and timestamp.

8.4 Demonstration Walkthrough

- Open the landing page and create an account, or log in with existing credentials.
- From the dashboard, choose a planner — Home Interior, Party, or Jewelry.
- Enter the total budget and category-specific requirements for the chosen planner.
- Submit the form and review the generated budget plan: total, remaining, and allocated amounts with per-category recommendations and marketplace tags.
- Open the History screen to show that plans are saved and can be revisited later.

8.5 Performance Evaluation Note

Performance is reported from actual measurements on the final deployment; this report does not fabricate response-time or load-test numbers that were not supplied with the project material.

8.6 Advantages Highlighted in the Demo

- **Forward-looking planning** — proactive budgeting rather than only historical expense tracking.
- **Complex decision support** — useful for fixed-budget, multi-category purchasing decisions.
- **Accessibility** — simple, browser-based access requiring no installation.
- **Actionable insights** — recommendation-oriented output rather than raw numbers alone.
- **Educational value** — a strong practical use case for full-stack architecture learning.
- **Scalability** — clear potential for future AI and third-party API integration.

8.7 Conclusion & Practical Impact

Pocket Smart AI demonstrates a practical budget-planning and recommendation workflow: a user distributes a fixed amount across connected requirements and reviews the resulting plan through a web interface. The demonstration shows user access, structured input, validation, budgeting logic, AI-assisted recommendation output, and interface integration working together as one coherent application, reducing the friction of planning multi-item purchases and providing a strong base for future personalization and cloud-scale deployment.
